

Write a Java program to demonstrate Multiple Inheritance using interfaces. Use constructors, method overriding and method overloading to calculate the total and average marks of a student.

Steps

1. Create interface **Total**.
2. Declare a method to calculate total marks.
3. Create interface **Average**.
4. Declare a method to calculate average.
5. Create class **Student**.
6. Implement both interfaces.
7. Create a constructor to initialize marks.
8. Override the methods of both interfaces.
9. Calculate total marks.
10. Calculate average marks.
11. Overload a calculation method with different parameters.
12. Create a **Student** object in **main()**.
13. Call the methods.
14. Display total and average.

Algorithm

START

1. Create interface Total.
2. Declare total calculation method.
3. Create interface Average.
4. Declare average calculation method.
5. Create class Student implementing Total and Average.
6. Declare three subject marks.
7. Initialize marks using constructor.
8. Implement the total calculation method.
9. Implement the average calculation method.
10. Calculate Total = M1 + M2 + M3.

11. Calculate Average = Total / 3.
12. Overload the calculation method.
13. Create Student object.
14. Call the methods.
15. Display Total and Average.

STOP

```
PROBLEMS  OUTPUT  DEBUG CONSOLE  TERMINAL  PORTS
